

## Workflow Management

**AI conversations  
are temporary.  
Your work shouldn't be.**

Durable working context for AI-assisted projects

Open source / Public overview / September 2026

# The restart problem

## The conversation ends. The project continues.

A new session needs more than the original task.

### The decision

Why did we choose  
this approach?

### The current state

What is finished,  
and what is blocked?

### The next step

Where should  
we pick up?

# Durable working context

Workflow Management stores useful project state outside individual AI conversations.

## **RECAP + sessions**

Current work, decisions and handoffs

## **Tasks + optional sprints**

Plans, progress and short-term goals

## **Focus + meetings**

Knowledge, outcomes and follow-ups

## **Roadmaps**

Direction, milestones and dependencies

# Your context. Your files.

## Each workspace can have its own `ai_context_<name>`.

Plain Markdown and JSON.  
The assistant proposes a context when none is configured.

Workspace-local context takes precedence over the user profile pointer.

### WORKSPACE-LOCAL CONTEXT

Create a separate context for each project workspace when histories must stay independent.

### SAFE SETUP

Setup creates the folder after confirmation and avoids the machine-wide pointer.

# A normal work session

01

## Start

Restore open work, blockers and the previous next steps.

02

## Work

Capture decisions, progress and useful findings.

03

## Close

Update the session and recap. Leave a concise handoff.

04

## Resume

Continue later using the same configured context.

**“Let's start a new work session.”**

Natural language is enough.

# A handoff you can read

## ILLUSTRATIVE EXAMPLE / CSV IMPORT

### Decision

Validate every row before writing any records.

### Current state

Validation is implemented.  
The error report needs clearer line numbers.

### Next step

Add an invalid-row test, then finish the report.

### Next conversation

**“Resume the CSV import work.”**

The assistant reads the saved context.  
You can inspect and correct it too.

# Portable through a shared workflow contract

The workflow belongs to the project,  
not to a single assistant.

## Supported assistants

Adapters implement  
the same contract

Configured files stay  
human-readable

## Other assistants

Can join when an  
adapter is available

Access to the chosen  
context is still required

Same project context. Shared workflow contract. No chat-history migration required.

# Knowledge that survives the session

## Study and ideas

“Keep these findings for our next session.”

Focus notes preserve analysis and evolving knowledge.

## Meetings and calls

“Save the decisions, owners and follow-ups.”

Meeting records make the outcomes available later.

## Project direction

“Update the roadmap with this milestone.”

Roadmaps connect daily work to longer-term goals.

# Alongside your existing tools

Each tool keeps its role.

**Git**

Source history

**Jira**

Issues and delivery tracking

**Documentation**

How the system works

**Workflow Management**

Decisions, progress and next steps  
across AI-assisted sessions

# Give your next session a starting point

- 1 Install your assistant's adapter.
- 2 Choose your ai-context location.
- 3 Start a work session.
